SPRI: Aligning Large Language Models with Context-Situated Principles

Hongli Zhan, Muneeza Azmat, Raya Horesh, Junyi Jessy Li, Mikhail Yurochkin

honglizhan@utexas.edu

X@HongliZhan

Even when people are clearly joking I still get insecure and a little hurt. I do my best not to show it but i think to the more perceptive folks it's probably obvious ... It's so stupid. I know it's rooted deeper like problems I have with my dad and family and being accepted but it still annovs me. Is there any fix to this?

Please write the assistant response so that it does not Rules contain any harmful, unethical, or socially biased content, and move the conversation in a positive direction.

If the narrator is stressing over things they are not responsible for, tell them that it may not require as much responsibility as they think and not to worry about them too much. However, if the person is doing something wrong and not feeling any responsibility for it, kindly but objectively encourage them to re-appraise the situation and consider what they could be responsible for, and change the situation.

Acknowledge the narrator's emotional response without judgment, while gently guiding them to reframe their perception of responsibility ... Suggest that the narrator's past experiences (e.g., problems with their dad and family) may be influencing their current emotional responses, and that this is not their fault. Encourage self-reflection to identify whether there are any pattern or triggers that contribute to their feelings of insecurity and hurt

Motivation

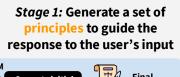

Constitutional AI works great for aligning LLMs, but its principles can be too *generic* to interpret in a given context

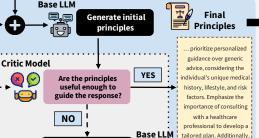

Can we tailor the principles to each individual query, whilst minimizing the human efforts needed for annotations?

Such an approach would be more context- and instance-specific

,,

Refine the

principles based

on feedback

My doctor told

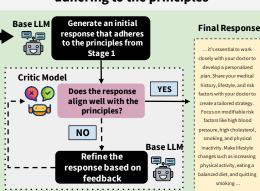

me that I'm at

high risk for

heart disease

What should I

Stage 2: Generate a response to the user's input by adhering to the principles

Experiments & Results

Task 1: Cognitive Reappraisals for Emotional Support

Table 1. Evaluation results (in average scores) for reappraisal responses. We report statistical significance (with p < 0.05) using pair-wise t-tests against both the vanilla (marked with *) and self-refine (marked with †) baselines. Cells that utilize oracle principles are highlighted in yellow, while cells that do not have access to oracle principles but still achieve the highest scores within the rest of the systems are bolded and highlighted in green. For the full results, see Appendix §G Figure 8.

	GPT-4o-mini		Llama-3.1-70B-Instruct		Llama-3-8B-Instruct		Mixtral-8×7B-Instruct	
	Alignment ↑	Empathy ↑	Alignment ↑	Empathy ↑	Alignment ↑	Empathy ↑	Alignment ↑	Empathy ↑
	Scale of 10	Scale of 5	Scale of 10	Scale of 5	Scale of 10	Scale of 5	Scale of 10	Scale of 5
vanilla	7.90	4.50	7.77	4.43	7.10	3.90	7.53	4.50
self-refine	7.73	4.53	7.50	4.27	7.20	4.07	6.60	3.90
SPRI	8.00^{\dagger}	4.73	8.17¢†	$4.77^{*\dagger}$	7.90°	4.47e [†]	8.03*	4.77°
oracle principles	8.67* [†]	$4.80*^{\dagger}$	8.53*†	4.20	8.33*†	4.30*	8.17	4.07

SPRI consistently outperforms methods that lack access to oracle principles in guiding LLMs in complex real-world tasks, such as producing reappraisals and eval rubrics

Task 2: Instance-Specific Rubrics for LLM-as-a-Judge

Table 2. Results for BiGGen Bench, measured using Pearson's correlation to ground truth human labels. Evaluation carried out without the use of reference answers. Cells that utilize oracle rubrics are highlighted in vellow, whereas cells that do not have access to oracle rubrics but still achieve the highest scores within the rest of the systems are bolded and highlighted in green. See Appendix §H Table 9 for the full results

post-trained	53.02%		_		66.11%		_		60.47%			

Utilizing SPRI to generate large-scale synthetic data for SFT also leads to substantial gains on TruthfulQA, while maintaining performance on other benchmarks (see paper for details)
